

## We have your tanks in our sites.

### We've just launched the latest in tank management.

Federal and local government regulations require owners and operators of fuel storage tanks to:

- Prevent releases
- Detect releases
- Correct problems

For UST's, you must keep records that can be provided to an inspector during an on-site visit to prove that your facility meets a number of requirements. You will need to keep records for:

- Leak Detection performance and maintenance
- Inspections and tests of your corrosion protection
- Information on repaired or upgraded UST systems
- Site assessment results after tank closure
- Documentation on financial responsibility

The Tank Module of the EnviroLIS system eases this regulatory burden and assists you in the management of your inspection and testing programs. Our Tank Module can:

- Maintain inventories of underground and above ground storage tanks for one or hundreds of your sites;
- Record dates of Scheduled Testing from pressure decay tests to fire suppression inspections
- Maintain records for your performance testing for all lines and dispensers
- Setup e-mails and reminders on critical dates. All you need to access the system is an internet connection.

Through the document management system, you will be able to maintain a copy of all documents and records in a centralized database related to the tank and its inspections. All relevant information is located in clearly defined categories and by the tank which it applies. The inspectors will be delighted.
